The SBE 61 CTD is designed for deployments on Argo floats

The SBE 61 Deep Argo CTD is a redesign of the SBE 41/41CP designed for deployments to 7000 m, with improved overall measurement quality and stability to meet the needs of deep ocean research.

Each SBE 61 is chosen from an extended calibration history, ensuring stable electronics and minimal drift in the field. The hardware interface and many commands have been carried over to make integration into existing SBE 41/41CP-based products easier.
